

***HETERODON NASICUS* (Plains Hog-nosed Snake).** USA: SOUTH DAKOTA: GREGORY Co.: north of Bristow, Nebraska, Fort Randall Church (ca. 43.04940°N, 98.56279°W; WGS 84). 1925. Charles E. Burt. Verified by Travis J. LaDuc. Carnegie Museum of Natural History (CM 19887). The original locality of this specimen was listed as Boyd County, Nebraska, but Fort Randall and the Fort Randall Chapel are located along the southwestern shore of the Missouri River in Gregory County, South Dakota, ca. 5.7 km N of the Nebraska state line. Though records from CM were included in Ballinger et al. (2000. *Trans. Nebraska Acad. Sci.* 26:29–46) and Davis et al. (2017. *Herpetol. Rev.* 48:394–406), the previous information that this specimen was cataloged under likely resulted in it being overlooked. This historic specimen represents the only known voucher specimen of this species in Gregory County (Ballinger et al. 2000, *op. cit.*). *Heterodon nasicus* is known from adjacent Brule, Charles Mix, and Tripp counties, South Dakota (Ballinger et al. 2000, *op. cit.*) and Boyd and Keya Paha counties, Nebraska (Ballinger et al. 2010. *Amphibians and Reptiles of Nebraska*. Rusty Lizard Press, Oro Valley, Arizona. 400 pp.; Fogell 2010. *A Field Guide to the Amphibians and Reptiles of Nebraska*. University of Nebraska-Lincoln, Lincoln, Nebraska. vi + 158 pp.). The nearest known record is from ca. 12.4 km to the north in Charles Mix County, South Dakota (National Museum of Natural History, Smithsonian Institution [USNM] 48814). I thank S. Kennedy-Gold for assistance examining this specimen.
